## Header

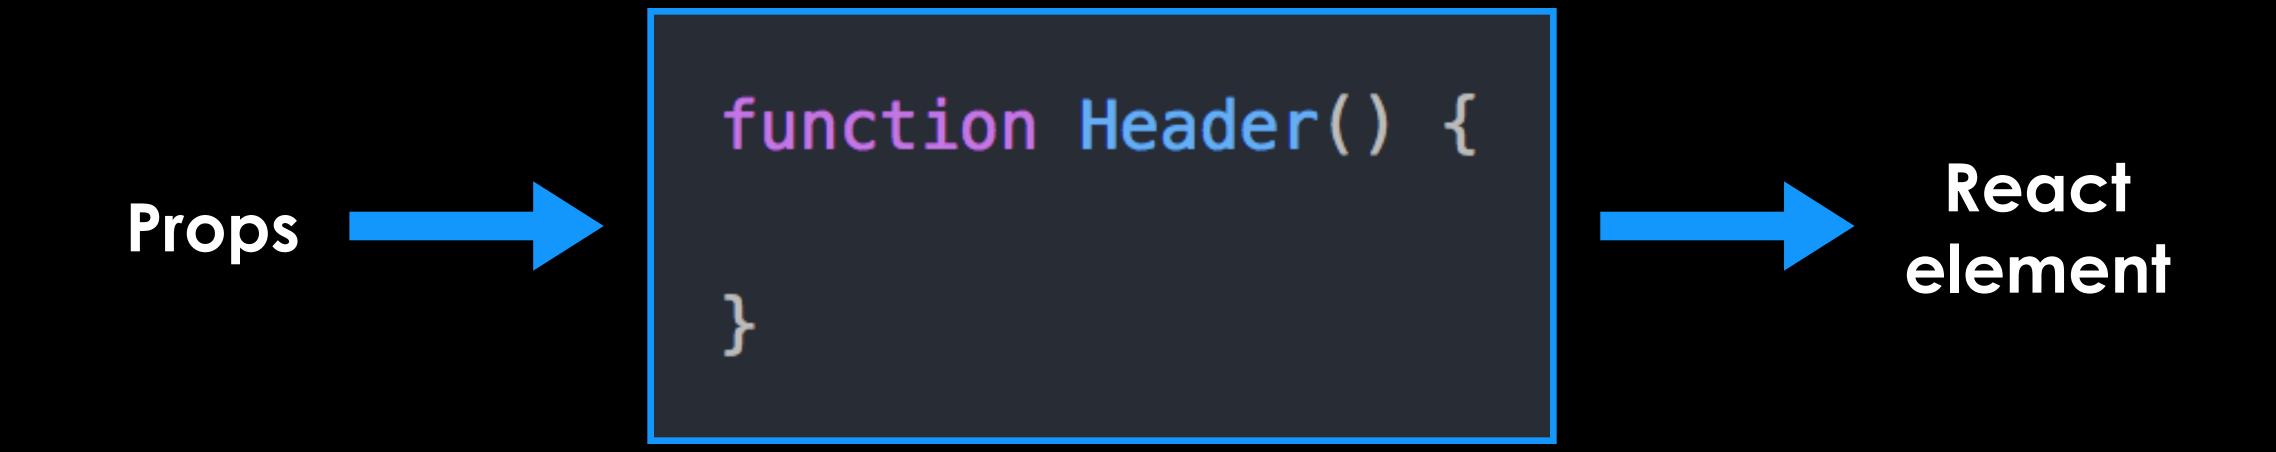

Slider

Sidebar

News

News

<header>
 <div>Header text</div>
 </header>

React element

DOM element

JSX

bit.ly/2ttPzcV

```
<Header headerText="Header text" />
```

### Functional components

### Class components

```
class Header extends React.Component {
    render() {
        this.props.headerText = 'New header text';
        return (
            <header>
                <div>{this.props.headerText}</div>
            </header>
```

### Props are read-only!

```
▶ Uncaught TypeError: Cannot assign to read only property react
'headerText' of object '#<0bject>'
at Header.render (<anonymous>:4:31)
```

# All React components must act like pure functions with respect to their props.

bit.ly/2ywNi6n

Use state to update a component.

```
class Header extends React.Component {
    constructor(props) {
        super(props);
        this.state = {
            headerText: props.headerText // Set initial state
        };
    changeHeaderText() {
        this.setState({ headerText: 'New header text' }); // Update state
    render() {
        return (
            <header>
                <div>{this.state.headerText}</div>
                <button onClick={this.changeHeaderText.bind(this)}>
                    Change header text
                </button>
            </header>
        );
```

#### Dumb/stateless components

```
function Loader(props) {
    let { type, style } = props,
        src = null;
   switch (type) {
        case 'green':
            src = 'green-loader.gif';
            break;
        case 'blue':
        default:
            src = 'blue-loader.gif';
            break;
   return (
       <img src={src} style={style} />
```

### Smart/statefull components

```
class ListMenu extends React.Component {
   constructor(props) {
       super(props);
       this.state = { hidden: true };
    toggleMenuVisibility() {
       this.setState((prevstate) => {
           return { hidden: !prevstate.hidden };
       });
    render() {
       return (
           <div>
                   !this.state.hidden ? (Item 1Item 2Item 2</or>
                  3) : null
               <button onClick={this.toggleMenuVisibility.bind(this)}>
                  Toggle Menu
               </button>
           </div>
       );
```

- Abstracting complexity
- Maintainability
- Reusability
- Ease of testing
